

THIRUMALASETTY HEMA KUMARI

SENIOR SOFTWARE DEVELOPER

913-915-3535 | hemakumarithirumalasetty8@gmail.com

PROFESSIONAL SUMMARY

Senior Software Developer with 7+ years of experience building scalable full-stack web applications using Python, FastAPI, Django, React.js, JavaScript, TypeScript, SQL, and cloud technologies. Strong experience designing responsive frontend applications, reusable React components, secure REST APIs, microservices, database-driven business workflows, and enterprise integrations. Hands-on with PostgreSQL, MongoDB, AWS, Azure, Docker, CI/CD, automated testing, logging, monitoring, and production support. Also experienced with data engineering and selected AI/ML solutions where they add business value, including classification, NLP, and Generative AI. Comfortable working across requirements, design, development, testing, deployment, troubleshooting, and Agile delivery with cross-functional teams.

TECHNICAL SKILLS

Category	Technologies / Skills
Programming Languages	Python, SQL, JavaScript, TypeScript, Bash
Frontend	React.js, Redux Toolkit, React Hooks, HTML5, CSS3, JavaScript, TypeScript, Bootstrap, responsive UI, reusable components
Python / Backend	FastAPI, Django, Flask, REST APIs, Pydantic, SQLAlchemy, Celery, Microservices, authentication, API integrations
Databases	PostgreSQL, MySQL, SQL Server, MongoDB, Redis
Data Engineering	Pandas, NumPy, PySpark, Apache Spark, Kafka, Airflow, ETL/ELT, data validation
AI / Machine Learning	Scikit-learn, XGBoost, NLP, LLMs, RAG, LangChain, Hugging Face, embeddings, vector search, model evaluation
Cloud	AWS: EC2, S3, Lambda, API Gateway, RDS, IAM, CloudWatch; Azure: App Service, Functions, Blob Storage, Key Vault, Monitor
DevOps	Docker, Kubernetes, Git, GitHub, Jenkins, GitHub Actions, CI/CD, environment configuration, monitoring
Testing / Tools	PyTest, unittest, Postman, Swagger/OpenAPI, JIRA, Confluence, VS Code, PyCharm, Agile, Scrum, SDLC

PROFESSIONAL EXPERIENCE

Senior Software Developer - Python Full Stack / AI & ML | Recent Experience

Wells Fargo, United States

Project Description: Worked on enterprise banking applications supporting customer servicing, account and transaction workflows, operational dashboards, internal approvals, reporting, and data-driven business processes. The role focused primarily on full-stack application development, secure API integration, reliability, and maintainable enterprise software.

Frontend:

- Developed responsive React.js screens for customer profiles, account details, transaction search, operational work queues, approvals, exception handling, and reporting dashboards used by banking operations teams.
- Built reusable functional components with React Hooks, TypeScript, HTML5, CSS3, and Bootstrap, creating consistent layouts and behavior across customer servicing and transaction workflow modules.
- Implemented Redux Toolkit to manage shared application state such as authenticated user information, account data, workflow status, filters, and information reused across multiple screens.
- Developed complex forms and data grids with field validation, conditional controls, search, filtering, sorting, pagination, confirmation messages, and clear error feedback for business users.
- Integrated React applications with secured REST APIs, handling asynchronous requests, response mapping, loading indicators, empty states, API failures, and user-friendly error messages.
- Implemented role-based navigation and protected routes so users could view screens, actions, and workflow options according to their assigned permissions and business responsibilities.
- Improved frontend performance and maintainability by organizing reusable components, API service modules, utilities, and UI logic while reducing duplicate code and unnecessary rendering.

Backend:

- Designed and developed Python REST APIs and microservices using FastAPI and Django to support account servicing, transaction workflows, operational processing, reporting, and internal banking integrations.
- Created API endpoints with Pydantic request and response models, validation rules, standardized HTTP status codes, exception handling, structured logging, and Swagger/OpenAPI documentation.
- Developed service and repository layers to clearly separate API routing, business rules, validation, and database-access responsibilities, making backend services easier to maintain and test.
- Implemented authentication and authorization controls for secured services, validating user identity and permissions before processing sensitive account, transaction, and workflow operations.
- Designed and optimized PostgreSQL and SQL Server queries, joins, indexes, and data-access logic to improve performance for transaction processing, reporting, search, and operational workflows.
- Built asynchronous and scheduled Python processes for file processing, reconciliation, data validation, notifications, and high-volume operational workloads that did not require synchronous API processing.
- Integrated backend services with internal and third-party REST APIs using secure data-exchange patterns, request validation, response mapping, retry handling, logging, and production troubleshooting.

AI / Machine Learning:

- Developed machine-learning use cases for transaction and operational data, including classification and anomaly-detection workflows to help identify patterns and exceptions for further business review.
- Prepared and transformed structured datasets using Pandas and Scikit-learn, including data cleaning, feature engineering, train/test preparation, and model evaluation.
- Built NLP and Generative AI proof-of-concepts for enterprise knowledge search using embeddings, vector search, LangChain, and approved internal content.
- Evaluated model performance using precision, recall, F1 score, confusion matrices, and business-oriented threshold analysis before presenting results to stakeholders.

Cloud / DevOps:

- Deployed and supported Python APIs and application services on Azure App Service, configuring application settings and environment-specific values for development, testing, and production environments.
- Used Azure Functions for scheduled and event-driven processing such as background jobs, file-processing activities, notifications, and lightweight integration workloads outside the main application services.
- Used Azure Blob Storage for application files and data exchange, and Azure Key Vault to securely manage secrets, connection information, API credentials, and other sensitive configuration values.
- Containerized backend services with Docker and supported Git-based CI/CD pipelines that automated builds, unit testing, environment configuration, deployment steps, and controlled application releases.
- Used Azure Monitor, application logs, and deployment diagnostics to track service health, identify API or infrastructure failures, troubleshoot production issues, and support root-cause analysis.

Environment: Python, FastAPI, Django, React.js, Redux Toolkit, TypeScript, JavaScript, PostgreSQL, SQL Server, Pandas, Scikit-learn, LangChain, LLMs, RAG, Azure, Docker, Git, PyTest, Postman, REST APIs

Senior Software Developer - Python Full Stack | Recent Experience**CDW, United States**

Project Description: Worked on an enterprise technology platform supporting product, customer, order, inventory, cloud-service, and operational information. The application used React-based user experiences and Python backend services to support enterprise search, reporting, workflow processing, and data-driven business operations.

Frontend:

- Developed React.js dashboards for product information, customer activity, inventory visibility, order status, enterprise search, and operational reporting used by business and support teams.
- Built reusable React components and custom Hooks and used Redux Toolkit to manage shared product, customer, order, inventory, and user-session state across application modules.
- Created responsive forms, data tables, filters, pagination, sorting, modal workflows, validation messages, loading indicators, and error states for data-intensive enterprise screens.
- Integrated frontend modules with secure Python REST APIs and transformed backend responses into UI-friendly models to provide consistent data presentation across product and order workflows.
- Implemented role-based screens, navigation, and action controls so business, operations, and support users could access functionality according to their workflow permissions.

- Improved frontend performance by reducing unnecessary renders, organizing shared components, optimizing client-side data handling, and standardizing reusable API and utility modules.
- Collaborated with UX, QA, backend, and business teams to resolve browser issues, API mapping defects, validation problems, and usability concerns across product, inventory, and order workflows.

Backend:

- Designed Python microservices using FastAPI to support product, customer, order, inventory, enterprise search, reporting, and operational workflow capabilities across the platform.
- Developed REST APIs with Pydantic validation, SQLAlchemy data access, structured logging, exception handling, standardized responses, and Swagger/OpenAPI documentation for service consumers.
- Created reusable service and repository layers to separate business logic, API routing, integration processing, and persistence responsibilities across backend application modules.
- Designed PostgreSQL and MongoDB persistence patterns and optimized queries and data retrieval for high-volume product catalogs, customer information, inventory, orders, and operational reporting.
- Built asynchronous processing and integration services for product feeds, inventory updates, order information, scheduled data workflows, and other background operations requiring reliable processing.
- Implemented authentication, authorization, request validation, error responses, audit-friendly logging, and secure integration patterns for enterprise APIs and internal services.
- Developed unit and integration tests with PyTest and supported production troubleshooting through application logs, API traces, database analysis, monitoring, and defect root-cause investigation.

Cloud / DevOps:

- Deployed Python APIs and application workloads on AWS EC2 and ECS, supporting scalable hosting and environment-specific configuration for enterprise product and order-processing services.
- Used Amazon S3 for product feeds, application files, integration data, and operational outputs, and implemented AWS Lambda functions for serverless and event-driven processing tasks.
- Worked with Amazon API Gateway to expose backend services and AWS IAM to manage secure permissions and controlled access between applications, services, and cloud resources.
- Containerized services with Docker and supported Git-based CI/CD pipelines with automated builds, PyTest execution, deployment validation, environment configuration, and controlled releases.
- Used Amazon CloudWatch for centralized logging, service monitoring, performance visibility, alerts, and troubleshooting of application failures and production issues.

Environment: Python, FastAPI, React.js, Redux Toolkit, TypeScript, JavaScript, PostgreSQL, MongoDB, AWS, Docker, Git, PyTest, Postman, Swagger/OpenAPI, REST APIs

Python Full Stack Developer | Previous Experience

Wings International, Vijayawada, Andhra Pradesh, India

Project Description: Developed a web-based platform supporting training, candidate profiles, course management, job opportunities, placement workflows, notifications, and operational reporting, with primary responsibility across React frontend development and Python backend services.

Frontend:

- Built React.js interfaces for candidate profiles, course enrollment, training progress, assessments, job opportunities, placement status, notifications, and operational dashboards.
- Created reusable components, Hooks, routing, forms, validation, search, filters, pagination, and responsive layouts using React, JavaScript, HTML5, CSS3, and Bootstrap.
- Managed shared UI data and workflow state using reusable state-management patterns and connected candidate, training, and placement screens to Python REST APIs.
- Implemented clear loading, success, validation, empty, and error states so users received meaningful feedback throughout API-driven training and placement workflows.
- Developed reusable table, form, navigation, and dashboard components to reduce duplicate frontend code and provide consistent behavior across application modules.
- Implemented protected routes and permission-based UI behavior so candidates, trainers, and operational users could access only the screens and actions relevant to their roles.
- Improved frontend maintainability and performance by organizing shared components, standardizing API service utilities, reducing duplicate rendering logic, and resolving cross-browser UI issues.

Backend:

- Developed Django and FastAPI services for candidates, training programs, assessments, job requirements, placement workflows, notifications, and operational reporting.
- Designed REST APIs with authentication, request validation, exception handling, reusable service layers, structured request/response models, and consistent API response patterns.
- Designed PostgreSQL and MongoDB data models for candidate profiles, training programs, jobs, assessments, placement activities, and related application information.
- Created Python automation and ETL scripts for importing candidate data, validating records, processing files, transforming information, and generating operational reports.
- Implemented scheduled jobs and notification processes to support training reminders, workflow updates, recurring business activities, and background application processing.
- Integrated backend services with internal and external REST APIs using validation, response mapping, retry handling, logging, and error-handling patterns for reliable data exchange.
- Wrote reusable Python modules and database-access logic, optimized application queries, performed unit/API testing, and supported defect investigation using logs, database queries, and Postman.

Cloud / DevOps:

- Hosted Python application services on AWS EC2 and used Amazon RDS for managed relational database workloads supporting candidate, training, and placement application data.
- Used Amazon S3 to store application files, imported datasets, generated reports, and other objects required by file-processing and operational workflows.
- Implemented AWS Lambda functions for lightweight scheduled jobs and event-driven processing, reducing the need to run simple background tasks within the main application servers.
- Used AWS IAM for controlled access to cloud resources and Amazon CloudWatch for application logging, service monitoring, issue investigation, and production troubleshooting.
- Containerized application components with Docker and supported Jenkins/Git CI/CD pipelines with automated testing, build validation, deployment steps, and reliable releases across environments.

Environment: Python, Django, FastAPI, React.js, JavaScript, PostgreSQL, MongoDB, AWS, Docker, Jenkins, Git, PyTest, REST APIs

Software Developer - Python | Earlier Experience**Hansetech Soft Solutions Private Limited, India**

Project Description: Worked on enterprise web applications, data-processing utilities, internal reporting, and workflow automation using Python. Responsibilities grew from backend development and scripting into full-stack application development and cloud-based deployment support.

Frontend:

- Developed responsive internal web screens using React.js, JavaScript, HTML5, CSS3, and Bootstrap for operational workflows, data entry, search, and business reporting.
- Built reusable forms, tables, search controls, filters, navigation elements, and dashboard components to provide consistent user experiences across internal application modules.
- Integrated frontend screens with Python REST APIs and implemented client-side validation, API response mapping, loading states, success notifications, and user-friendly error handling.
- Implemented React routing and navigation patterns to support multi-page business workflows and provide consistent movement between operational and reporting modules.
- Worked on responsive layout improvements and cross-browser fixes to maintain consistent screen behavior and usability across supported desktop environments.
- Separated reusable UI components, utilities, and API interaction logic to improve code maintainability and reduce duplication as application functionality expanded.
- Collaborated with QA and backend teams to troubleshoot UI defects, API mapping issues, validation problems, browser compatibility concerns, and production-facing workflow issues.

Backend:

- Developed Python applications using Django and Flask, including REST APIs, authentication, business logic, reporting services, scheduled jobs, and third-party system integrations.
- Created reusable Python modules for file processing, data validation, workflow automation, API integrations, data transformation, and scheduled movement of application information.

- Worked with SQL Server, MySQL, PostgreSQL, and MongoDB and wrote queries and data-access logic supporting application workflows, operational processing, and reporting features.
- Implemented backend validation, exception handling, structured application logging, and consistent API responses to simplify troubleshooting and frontend integration.
- Built scheduled scripts and batch processes for recurring file-processing, data-processing, workflow automation, and reporting requirements used by internal business teams.
- Integrated backend services with internal and external REST APIs using request validation, response mapping, retry/error handling, and logging to support reliable data exchange.
- Created unit tests for Python business logic and participated in code reviews, database query tuning, defect fixes, release validation, production support, and root-cause investigation.

Cloud / DevOps:

- Supported deployment of Python web applications on AWS EC2 and used Amazon RDS for managed relational database hosting across development and application environments.
- Used Amazon S3 for application file storage, data-processing inputs and outputs, and other object-storage requirements used by backend workflows and reporting processes.
- Worked with AWS IAM to configure controlled access to cloud resources and followed environment-based configuration practices for application credentials and service permissions.
- Used Amazon CloudWatch for application logs, infrastructure monitoring, production issue investigation, and troubleshooting of service and deployment-related failures.
- Worked with Docker, Git, and Jenkins to package application services and support CI/CD activities including automated builds, unit testing, deployment validation, and controlled releases.

Environment: Python, Django, Flask, React.js, JavaScript, HTML5, CSS3, SQL Server, MySQL, PostgreSQL, MongoDB, AWS, Docker, Jenkins, Git, REST APIs

EDUCATION

Master's in Computer Science and Technology Management

Avila University, Kansas City, Missouri, USA

Bachelor's in Computer Science

Andhra Pradesh, India
